Amazon Route 53

What is DNS?

- Domain Name System which translates the human friendly hostnames into the machine IP addresses
- <u>www.google.com</u> => 172.217.18.36
- DNS is the backbone of the Internet
- DNS uses hierarchical naming structure

.com

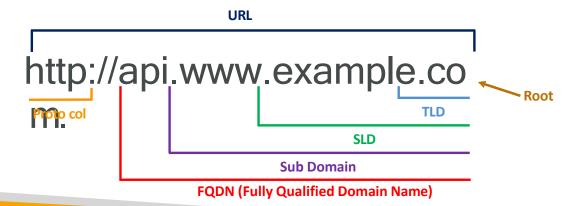

example.com

www.example.com

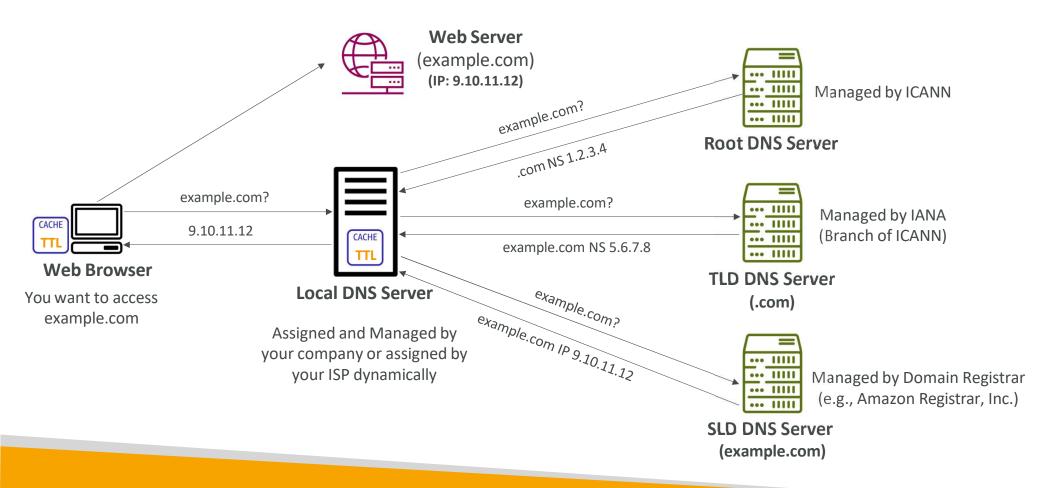

api.example.com

DNS Terminologies

- Domain Registrar: Amazon Route 53, GoDaddy, ...
- DNS Records: A, AAAA, CNAME, NS, ...
- Zone File: contains DNS records
- Name Server: resolves DNS queries (Authoritative or Non-Authoritative)
- Top Level Domain (TLD): .com, .us, .in, .gov, .org, ...
- Second Level Domain (SLD): amazon.com, google.com, ...

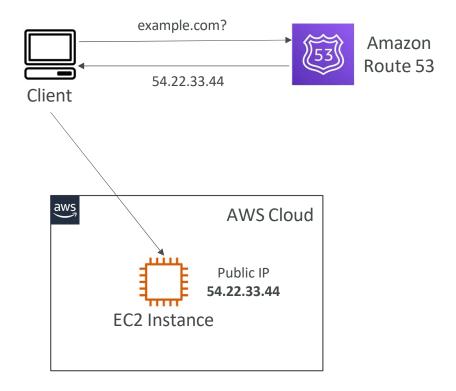

How DNS Works

Amazon Route 53

- A highly available, scalable, fully managed and Authoritative DNS
 - Authoritative = the customer (you) can update the DNS records
- Route 53 is also a Domain Registrar
- Ability to check the health of your resources
- The only AWS service which provides 100% availability SLA
- Why Route 53? 53 is a reference to the traditional DNS port

Route 53 - Records

- How you want to route traffic for a domain
- Each record contains:
 - Domain/subdomain Name e.g., example.com
 - Record Type e.g., A or AAAA
 - Value e.g., 12.34.56.78
 - Routing Policy how Route 53 responds to queries
 - TTL amount of time the record cached at DNS Resolvers
- Route 53 supports the following DNS record types:
 - (must know) A / AAAA / CNAME / NS
 - (advanced) CAA / DS / MX / NAPTR / PTR / SOA / TXT / SPF / SRV

Route 53 - Record Types

- A maps a hostname to IPv4
- AAAA maps a hostname to IPv6
- CNAME maps a hostname to another hostname
 - The target is a domain name which must have an A or AAAA record
 - Can't create a CNAME record for the top node of a DNS namespace (Zone Apex)
 - Example: you can't create for example.com, but you can create for www.example.com
- NS Name Servers for the Hosted Zone
 - Control how traffic is routed for a domain

Route 53 - Hosted Zones

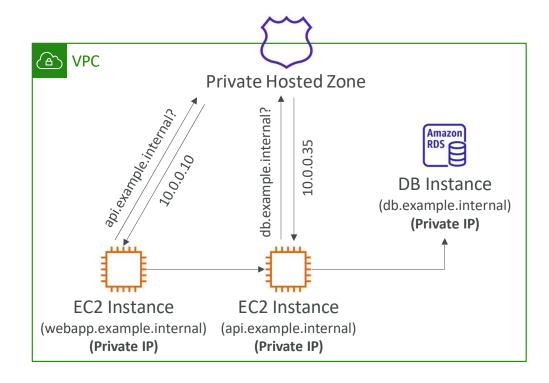

- A container for records that define how to route traffic to a domain and its subdomains
- Public Hosted Zones contains records that specify how to route traffic on the Internet (public domain names) application1.mypublicdomain.com
- Private Hosted Zones contain records that specify how you route traffic within one or more VPCs (private domain names) application1.company.internal
- You pay \$0.50 per month per hosted zone

Route 53 - Public vs. Private Hosted Zones

Public Hosted Zone

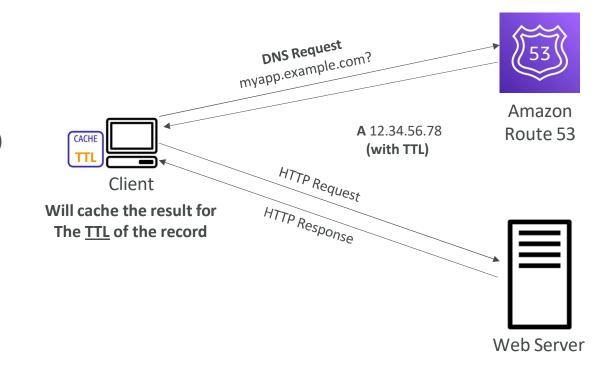

S3 Bucket Amazon CloudFront CloudFront Public IP) S4.22.33.44 Public Hosted Zone EC2 Instance Application Load Balancer

Private Hosted Zone

Route 53 - Records TTL (Time To Live)

- High TTL e.g., 24 hr
 - Less traffic on Route 53
 - Possibly outdated records
- Low TTL e.g., 60 sec.
 - More traffic on Route 53 (\$\$)
 - Records are outdated for less time
 - Easy to change records
- Except for Alias records,
 TTL is mandatory for each
 DNS record

CNAME vs Alias

- AWS Resources (Load Balancer, CloudFront...) expose an AWS hostname:
 - lb1-1234.us-east-2.elb.amazonaws.com and you want myapp.mydomain.com

CNAME:

- Points a hostname to any other hostname. (app.mydomain.com => blabla.anything.com)
- ONLY FOR NON ROOT DOMAIN (aka. something.mydomain.com)

Alias:

- Points a hostname to an AWS Resource (app.mydomain.com => blabla.amazonaws.com)
- Works for ROOT DOMAIN and NON ROOT DOMAIN (aka mydomain.com)
- Free of charge
- Native health check

Route 53 - Alias Records

- Maps a hostname to an AWS resource
- An extension to DNS functionality
- Automatically recognizes changes in the resource's IP addresses
- Unlike CNAME, it can be used for the top node of a DNS namespace (Zone Apex), e.g.: example.com
- Alias Record is always of type A/AAAA for AWS resources (IPv4 / IPv6)
- You can't set the TTL

Amazon Route 53

Alias Record (Enabled)

Record Name	Туре	Value		
example.com	Α	MyALB-123456789.us- east- 1.elb.amazonaws.com		

MyALB-123456789.us-east-1.elb.amazonaws.com

<u>AWS-Managed</u> (IP Addresses might change)

Application
Load Balancer

Route 53 - Alias Records Targets

- Elastic Load Balancers
- CloudFront Distributions
- API Gateway
- Elastic Beanstalk environments
- S3Websites
- VPC Interface Endpoints
- Global Accelerator accelerator
- Route 53 record in the same hosted zone

Elastic Load Balancer

Amazon CloudFront

You cannot set an ALIAS record for an EC2 DNS name

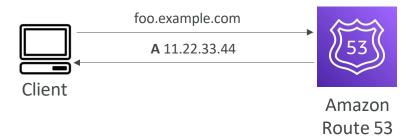

Route 53 - Routing Policies

- Define how Route 53 responds to DNS queries
- Don't get confused by the word "Routing"
 - · It's not the same as Load balancer routing which routes the traffic
 - DNS does not route any traffic, it only responds to the DNS queries
- Route 53 Supports the following Routing Policies
 - Simple
 - Weighted
 - Failover
 - Latency based
 - Geolocation
 - Multi-Value Answer
 - Geoproximity (using Route 53 Traffic Flow feature)

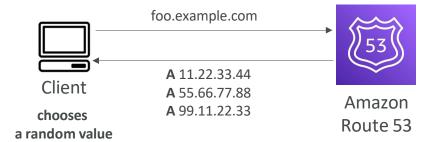

Routing Policies - Simple

- Typically, route traffic to a single resource
- Can specify multiple values in the same record
- If multiple values are returned, a random one is chosen by the <u>client</u>
- When Alias enabled, specify only one AWS resource
- Can't be associated with Health Checks

Single Value

Multiple Value

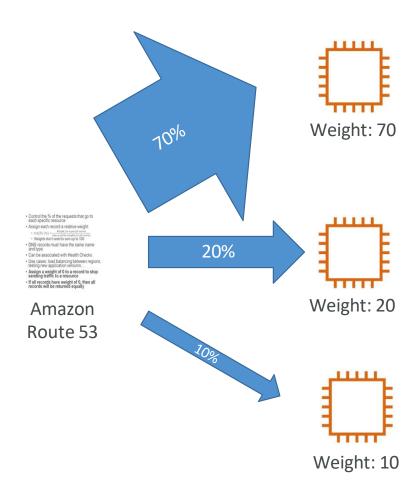

Routing Policies - Weighted

- Control the % of the requests that go to each specific resource
- Assign each record a relative weight:

•
$$traffic$$
 (%) = $\frac{!"#$\%\& ()* +, -".#(#.*".)*/}{012)(+38\%"4"#$\%\&, ()* +33*".)*/,}$

- Weights don't need to sum up to 100
- DNS records must have the same name and type
- Can be associated with Health Checks
- Use cases: load balancing between regions, testing new application versions...
- Assign a weight of 0 to a record to stop sending traffic to a resource
- If all records have weight of 0, then all records will be returned equally

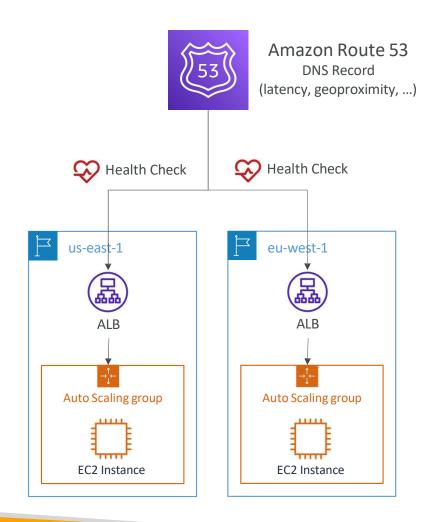

Routing Policies - Latency-based

- Redirect to the resource that has the least latency close to us
- Super helpful when latency for users is a priority
- Latency is based on traffic between users and AWS Regions
- Germany users may be directed to the US (if that's the lowest latency)
- Can be associated with Health Checks (has a failover capability)

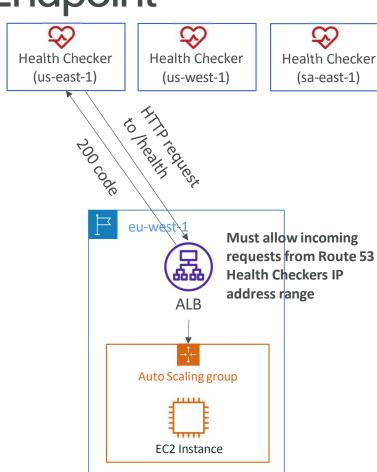

Route 53 - Health Checks

- HTTP Health Checks are only for public resources
- Health Check => Automated DNS Failover:
 - 1. Health checks that monitor an endpoint (application, server, other AWS resource)
 - 2. Health checks that monitor other health checks (Calculated Health Checks)
 - 3. Health checks that monitor CloudWatch Alarms (full control !!) e.g., throttles of DynamoDB, alarms on RDS, custom metrics, ... (helpful for private resources)
- Health Checks are integrated with CW metrics

Health Checks - Monitor an Endpoint

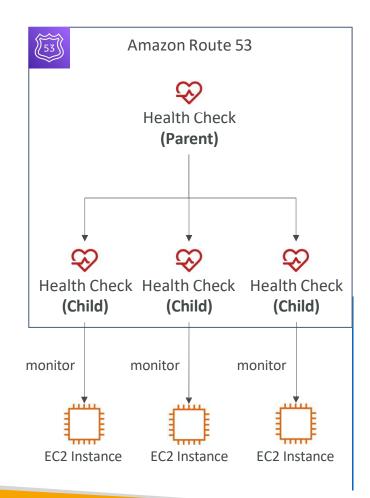

- About 15 global health checkers will check the endpoint health
 - Healthy/Unhealthy Threshold 3 (default)
 - Interval 30 sec (can set to 10 sec higher cost)
 - Supported protocol: HTTP, HTTPS and TCP
 - If > 18% of health checkers report the endpoint is healthy, Route 53 considers it Healthy. Otherwise, it's Unhealthy
 - Ability to choose which locations you want Route 53 to use
- Health Checks pass only when the endpoint responds with the 2xx and 3xx status codes
- Health Checks can be setup to pass / fail based on the text in the first 5120 bytes of the response
- Configure you router/firewall to allow incoming requests from Route 53 Health Checkers

https://ip-ranges.amazonaws.com/ip-ranges.json

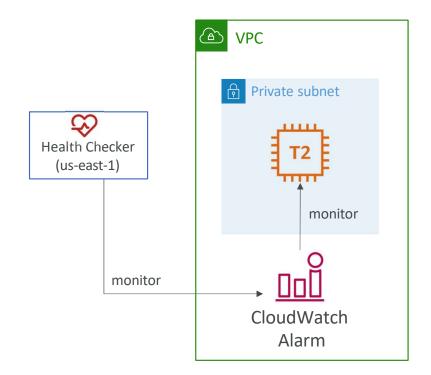

Route 53 - Calculated Health Checks

- Combine the results of multiple Health Checks into a single Health Check
- You can use OR, AND, or NOT
- Can monitor up to 256 Child Health Checks
- Specify how many of the health checks need to pass to make the parent pass
- Usage: perform maintenance to your website without causing all health checks to fail

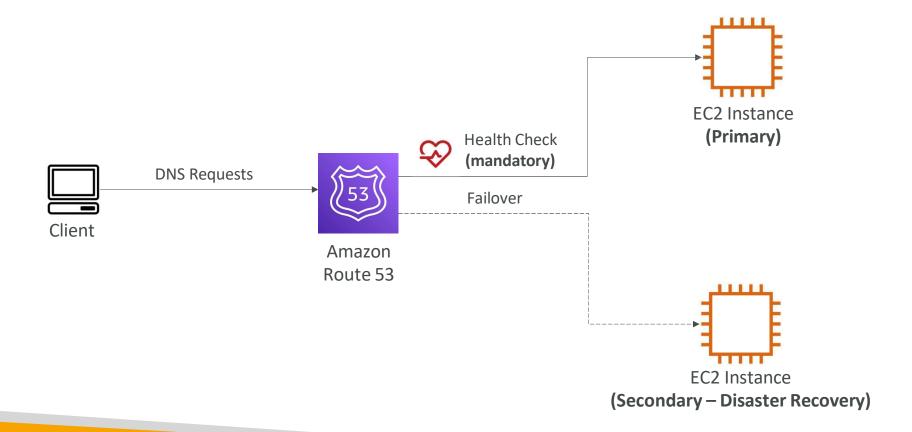

Health Checks - Private Hosted Zones

- Route 53 health checkers are outside the VPC
- They can't access private endpoints (private VPC or on-premises resource)
- You can create a CloudWatch Metric and associate a CloudWatch Alarm, then create a Health Check that checks the alarm itself

Routing Policies - Failover (Active-Passive)

Routing Policies - Geolocation

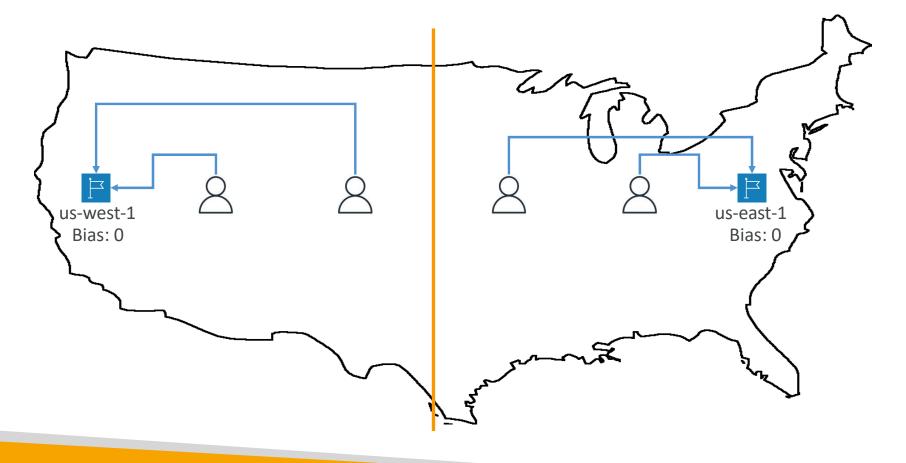

- Different from Latency-based!
- This routing is based on user location
- Specify location by Continent, Country or by US State (if there's overlapping, most precise location selected)
- Should create a "Default" record (in case there's no match on location)
- Use cases: website localization, restrict content distribution, load balancing, ...
- Can be associated with Health Checks

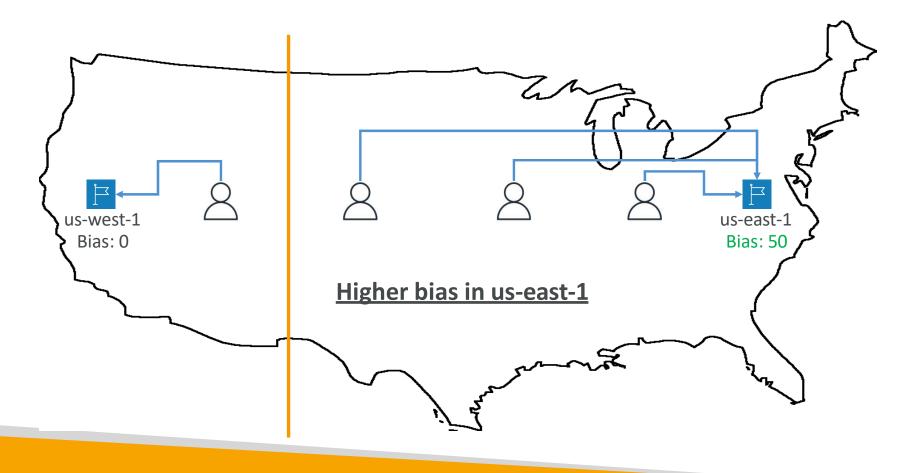

Routing Policies - Geoproximity

- Route traffic to your resources based on the geographic location of users and resources
- Ability to shift more traffic to resources based on the defined bias
- To change the size of the geographic region, specify bias values:
 - To expand (1 to 99) more traffic to the resource
 - To shrink (-1 to -99) less traffic to the resource
- Resources can be:
 - AWS resources (specify AWS region)
 - Non-AWS resources (specify Latitude and Longitude)
- You must use Route 53 Traffic Flow to use this feature

Routing Policies - Geoproximity

Routing Policies - Geoproximity

Routing Policies - IP-based Routing

- Routing is based on clients' IP addresses
- You provide a list of CIDRs for your clients and the corresponding endpoints/locations (user-IP-to-endpoint mappings)
- Use cases: Optimize performance, reduce network costs...
- Example: route end users from a particular ISP to a specific endpoint

Routing Policies - Multi-Value

- Use when routing traffic to multiple resources
- Route 53 return multiple values/resources
- Can be associated with Health Checks (return only values for healthy resources)
- Up to 8 healthy records are returned for each Multi-Value query
- Multi-Value is not a substitute for having an ELB

Name	Туре	Value	TTL	Set ID	Health Check
www.example.com	A Record	192.0.2.2	60	Web1	Α
www.example.com	A Record	198.51.100.2	60	Web2	В
www.example.com	A Record	203.0.113.2	60	Web3	C

Domain Registar vs. DNS Service

- You buy or register your domain name with a Domain Registrar typically by paying annual charges (e.g., GoDaddy, Amazon Registrar Inc., ...)
- The Domain Registrar usually provides you with a DNS service to manage your DNS records
- But you can use another DNS service to manage your DNS records
- Example: purchase the domain from GoDaddy and use Route 53 to manage your DNS records

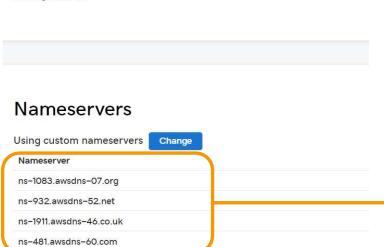

GoDaddy as Registrar & Route 53 as DNS Service

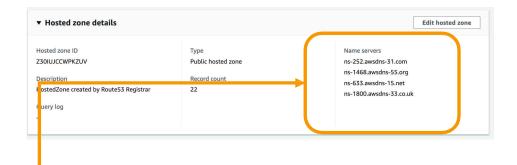

Records

We can't display your DNS information because your nameservers aren't managed by us.

Public Hosted Zone stephanetheteacher.com

3rd Party Registrar with Amazon Route 53

- If you buy your domain on a 3rd party registrar, you can still use Route 53 as the DNS Service provider
- 1. Create a Hosted Zone in Route 53
- 2. Update NS Records on 3rd party website to use Route 53 Name Servers
- Domain Registrar != DNS Service
- But every Domain Registrar usually comes with some DNS features
